

Pattern matching on encrypted streams

Élie Bouscatié Guilhem Castagnos Olivier Sanders

November 29, 2022

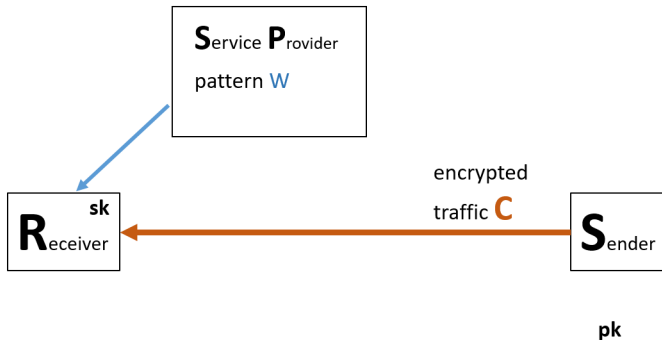

Context

Public key encryption

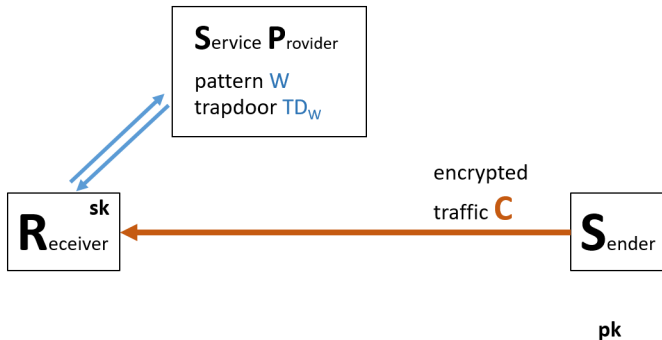

- In 2021, 80-90% of the worldwide internet traffic was encrypted.
- Classical encryption incompatible with functionalities such as Intrusion Detection Systems (IDS).

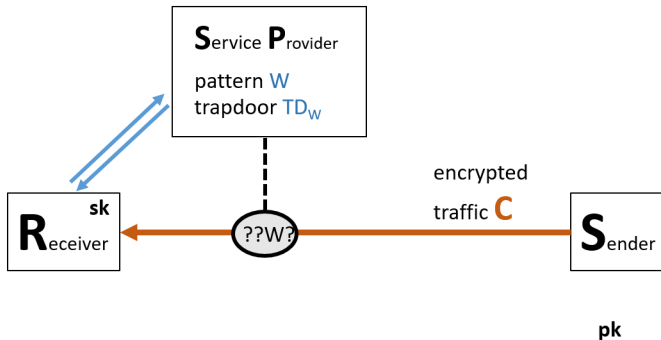

Functional encryption for pattern matching

Functional encryption for pattern matching

Functional encryption for pattern matching

Allow Service Provider to detect virus signatures inside internet traffic with

- minimal leakage
- minimal interactivity
- updating virus signatures
- variable length of virus signatures

Handle arbitrary long messages

arbitrary long Encrypted Data:

Banana

From Wikipedia, the free encyclopedia

This article is about **bananas** generally. For the genus to which **banana** plants belong, see *Musa* (genus). For starchier **bananas** used in cooking, see *Cooking banana*. For the most common commercial type, see *Cavendish banana*. For other uses, see *Banana (disambiguation)*.

A **banana** is an elongated, edible fruit – botanically a berry^{[1][2]} – produced by several kinds of large herbaceous flowering plants in the genus *Musa*.^[3] In some countries, **bananas used for cooking** may be called "plantains", distinguishing them from **dessert bananas**. The fruit is variable in size, color, and firmness, but is usually elongated and curved, with soft flesh rich in starch covered with a rind, which may be green, yellow, red, purple, or brown when ripe. The fruits grow upward in clusters near the top of the plant. Almost all modern edible seedless (*parthenocarp*) **bananas** come from two wild species – *Musa acuminata* and *Musa balbisiana*. The scientific names of most cultivated **bananas** are *Musa acuminata*, *Musa balbisiana*, and *Musa × paradisiaca* for the hybrid *Musa acuminata* × *M. balbisiana*, depending on their **genomic** constitution. The old scientific name for this hybrid, *Musa sapientum*, is no longer used.

Musa species are native to tropical Indomalaya and Australia, and are likely to have been first domesticated in Papua New Guinea.^{[4][5]} They are grown in 135 countries,^[6] primarily for their fruit, and to a lesser extent to make **fiber**, **banana wine**, and **banana beer** and as ornamental plants. The world's largest producers of **bananas** in 2017 were India and China, which together accounted for approximately 38% of total production.^[7]

Worldwide, there is no sharp distinction between "**bananas**" and "plantains". Especially in the Americas and Europe, "**banana**" usually refers to soft, sweet, dessert **bananas**, particularly those of the Cavendish group, which are the main exports from **banana**-growing countries. By contrast, *Musa* cultivars with firmer, starchier fruit are called "plantains". In other regions, such as Southeast Asia, many more kinds of **banana** are grown and eaten, so the binary distinction is not as useful and is not made in local languages.

Give $\mathbf{td}_{boat,1}$, $\mathbf{td}_{boat,2}$, $\mathbf{td}_{boat,3}$, $\mathbf{td}_{boat,4}$, ..., $\mathbf{td}_{boat,15}$.

Search all occurrences of bounded substrings in arbitrary long encryption = "Stream Encryption supporting Pattern Matching" (SEPM)

Example of pattern distribution

- Snort pattern length distribution (based on version 2.3.3)¹
Total number of patterns = 1785, Maximum length = 107 bytestrings

- Search many patterns of **varying short sizes in arbitrary long streams**.

¹Song et al., A parameterized multilevel pattern matching architecture on FPGAs for network intrusion detection and prevention. Sci. China Ser. F-Inf. Sci. 52, 949–963 (2009).

Build an HVE

Type 3 bilinear groups

- G_1 , G_2 , and G_T of prime order p with a map, called pairing,

$$e : G_1 \times G_2 \rightarrow G_T$$

Type 3 bilinear groups

- G_1 , G_2 , and G_T of prime order p with a map, called pairing,

$$e : G_1 \times G_2 \rightarrow G_T$$

- Bilinear: for any $g \in G_1$, $\tilde{g} \in G_2$, and $a, b \in \mathbb{F}_p$,

$$e(g^a, \tilde{g}^b) = e(g, \tilde{g})^{ab}$$

Trapdoors for DDH

Let $g \in G_1$ and $\tilde{g} \in G_2$ be public.

- (DDH) Knowing $g^a, g^x \in G_1$,
it is **hard** to distinguish $\zeta_0 = g^{ax}$ from $\zeta_1 \in G_1$.

Trapdoors for DDH

Let $g \in G_1$ and $\tilde{g} \in G_2$ be public.

- **(DDH)** Knowing $g^a, g^x \in G_1$, it is **hard** to distinguish $\zeta_0 = g^{ax}$ from $\zeta_1 \in G_1$.
- **(Trapdoor)** With \tilde{g}^x , it becomes **easy**:

$$e(g^a, \tilde{g}^x) = e(g, \tilde{g})^{ax} = e(g^{ax}, \tilde{g}) \quad \text{but} \quad e(\zeta_1, \tilde{g}) \text{ is random.}$$

Trapdoors for DDH

Let $g \in G_1$ and $\tilde{g} \in G_2$ be public.

- **(DDH)** Knowing $g^a, g^x \in G_1$,

it is **hard** to distinguish $\zeta_0 = g^{ax}$ from $\zeta_1 \in G_1$.

- **(Trapdoor)** With \tilde{g}^x , it becomes **easy**:

$$e(g^a, \tilde{g}^x) = e(g, \tilde{g})^{ax} = e(g^{ax}, \tilde{g}) \quad \text{but} \quad e(\zeta_1, \tilde{g}) \text{ is random.}$$

- **(Mirror elements)** In **type 3** bilinear groups, it is hard to compute \tilde{g}^x from g^x .

Trapdoors for DDH

Let $g \in G_1$ and $\tilde{g} \in G_2$ be public.

- **(DDH)** Knowing $g^a, g^x \in G_1$, it is **hard** to distinguish $\zeta_0 = g^{ax}$ from $\zeta_1 \in G_1$.
- **(Trapdoor)** With \tilde{g}^x , it becomes **easy**:

$$e(g^a, \tilde{g}^x) = e(g, \tilde{g})^{ax} = e(g^{ax}, \tilde{g}) \quad \text{but} \quad e(\zeta_1, \tilde{g}) \text{ is random.}$$

- **(Mirror elements)** In **type 3** bilinear groups, it is hard to compute \tilde{g}^x from g^x .
- **(Randomness on trapdoors)** With some \tilde{g}^s and \tilde{g}^{sx} :

$$e(g^{ax}, \tilde{g}^s) = e(g, \tilde{g})^{sax} = e(g^a, \tilde{g}^{sx})$$

! This will allow the Receiver to issue non-malleable trapdoors.

g^a $(g^{x_1}(g^{y_1})^s)^a$ $(g^{x_2}(g^{y_2})^t)^a$ $(g^{x_3}(g^{y_3})^e)^a$ $(g^{x_4}(g^{y_4})^a)^a$ $(g^{x_5}(g^{y_5})^m)^a$

Lighter public key

■ $sk = (x_i, y_i)_{i=1}^n \in \mathbb{F}_p \times \mathbb{F}_p$ ■ $pk = (g^{x_i}, g^{y_i})_{i=1}^n$

■ Encryption with pk

$a \in \mathbb{F}_p$ s t e a m

C_0 C_1 C_2 C_3 C_4 C_5

\parallel \parallel \parallel \parallel \parallel \parallel

g^a $(g^{x_1+y_1s})^a$ $(g^{x_2+y_2t})^a$ $(g^{x_3+y_3e})^a$ $(g^{x_4+y_4a})^a$ $(g^{x_5+y_5m})^a$

Lighter HVE

- $\mathbf{sk} = f(x_i, y_i, z_i) \in \mathbb{F}_p, g_1 \dots g_n$
- $\mathbf{pk} = f, g^{x_i}, g^{y_i}, g^{z_i}, g_1 \dots g_n$
- Encryption with \mathbf{pk}

- Trapdoor with \mathbf{sk}

$$s_1, s_2 \in \mathbb{F}_p \quad \mathbf{td}_m = f, T_1 = \tilde{g}^{s_1}, T_2 = \tilde{g}^{s_2}, T^\circ = \tilde{g}^{s_1 \sum (x_i + y_i m_i) + s_2 \sum z_i}$$

- Test

$$e\left(\prod_{i=2}^4 C_i, T_1\right) e\left(\prod_{i=2}^4 C_i^\circ, T_2\right) = e(C_0, T^\circ)$$

Inner Product Encryption

Test if $\langle \text{message vector}, \text{trapdoor vector} \rangle = 0$.

- stronger security notion (adaptivity)
- weaker assumptions (DLIN)
- can be used as HVE scheme
